

# US long-term reversal experiment

Simulation-only evidence report · run completed 19 September 2026

VERDICT: REJECT

All four predeclared gates failed. This is not a deployable strategy result.

## What was tested

A zero-investment US equity long-term reversal factor: long stocks with weak prior multi-year returns and short prior long-term winners. Monthly published LT Rev returns were reduced by an assumed 0.15% monthly implementation drag. This cost is a model assumption, not measured from constituent holdings.

| Period    | Months | Ann. return | Volatility | Sharpe | CAGR    | Max drawdown |
|-----------|--------|-------------|------------|--------|---------|--------------|
| Full      | 1147   | 1.587%      | 11.989%    | 0.132  | 0.911%  | -65.869%     |
| Pre-2000  | 828    | 2.615%      | 12.627%    | 0.207  | 1.886%  | -56.379%     |
| Jan 2000+ | 319    | -1.080%     | 10.126%    | -0.107 | -1.576% | -65.869%     |

## Predeclared gates

FAIL · Full Sharpe  $\geq 0.50$

FAIL · Jan 2000+ Sharpe  $\geq 0.40$

FAIL · Positive net mean in both subsamples

FAIL · Full max drawdown  $\geq -60\%$

# Predeclaration

# Predeclaration: US equity long-term reversal

Created before this run accesses its dataset.

## ## Thesis

A zero-investment US equity portfolio long stocks with weak returns over the prior multi-year formation period and short prior long-term winners earns a positive net premium as extrapolative mispricing mean-reverts. This cross-sectional long-term reversal experiment is economically distinct from one-month reversal, 12-to-2 momentum, aggregate market timing, value, size, profitability and all FX runs.

## ## Dataset

Kenneth R. French Data Library monthly Long-Term Reversal Factor (LT Rev), first available month through latest complete month. Select the return column by detecting the sole non-date numeric column under the monthly section, record source member and archive checksum. Fixed source URL in SOURCE.txt.

## ## Simulation and cost boundary

Use the published monthly LT Rev return without fitted parameters. Subtract 0.15% every month as an assumed all-in implementation drag. It is not measured from security holdings. Evaluate full sample, pre-2000 and fixed January-2000-forward subsample. Annual arithmetic return = mean x 12; annual volatility = sample SD x sqrt(12); zero-financing Sharpe; compounded net CAGR and maximum drawdown.

## ## Rejection gates

Reject unless all pass net of assumed cost: full Sharpe  $\geq 0.50$ ; January-2000-forward Sharpe  $\geq 0.40$ ; positive monthly net mean both before 2000 and from 2000; full maximum drawdown no worse than -60%. No changes after source access.
